It's all about geometry

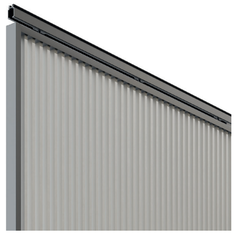

Eclipsis 45°

The distinctive 45° angle of the louvres adds depth to the surface and creates successive lines of shadow. A version with a clear geometric identity.

Eclipsis Pivot

Adjustable louvre tilt offers an additional way to control light and visual contact with the outdoors, alongside the sliding movement of the panel.

Eclipsis Axis

The vertical arrangement gives rhythm to the façade and emphasizes the height of the openings. Shading takes on a clean, linear presence.

Choose your texture

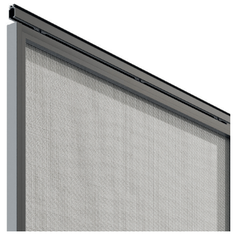

Eclipsis Wood

The wood-effect finish adds warmth to the panel's geometry and connects shading with natural tones and textures.

Eclipsis Grid

The aluminum mesh creates a filter between the interior and the outdoors. Its lattice structure gives the panel a dynamic texture and a sense of visual lightness.

Eclipsis Tela

The fabric adds texture and a softer visual presence to the panel's linear frame, creating a different and warmer expression of architectural shading.

Eclipsis

architectural sliding panels

Shading that defines the façade.

Eclipsis sliding panels combine clean architectural lines with high functionality, offering a versatile shading solution for contemporary buildings, residences and hotel developments. Made from durable, high-specification aluminum, the panels slide along guide tracks, giving full control over light, shade and privacy.

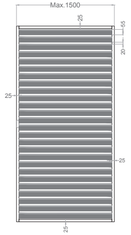

The Eclipsis system is available in a wide range of colors and finish textures, so it suits any architectural identity. It also improves the building's energy performance by reducing solar heat gain during the summer months.

Weather-resistant and designed for minimal maintenance, Eclipsis panels are an ideal choice for architects seeking shading with character, precise construction and long-term reliability.

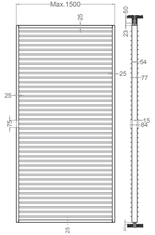

- Six (6) different versions.
- Powder coating in all RAL colors
- Brake mechanism for maximum control of movement
- Available also as a fixed version
